Global Institute of Sustainability K-12 Education Outreach Group
What are some ways people change landscapes?

How has the Phoenix landscape changed?
How did we change the landscape?

Add roads and buildings - changes local temperatures

Add Water

Bring new plants

Lose habitat for wildlife
What do people do that causes the most change in landscapes?

Farming (agriculture and animal herding)
How did we get food before farming began?

When did we start farming?
Neolithic Revolution: Farming - 10,000 years old
Or Is It New?

Earliest fossils for Homo sapiens in Ethiopia: Hunt and gather

195,000 BCE

8,000 BCE
Neolithic Period
Invention of Farming

12,000 BCE
Paleolithic Modern Humans

Farming then...  

- Began 10,000 years ago
- Mediterranean suitable for growing food
  - Climate warming, more rain
  - Forested, rich soils
  - Rain fed
  - “fertile crescent”

http://userww.sfsu.edu/~patters/culinary/media/fertilec.jpg
Neolithic Revolution
Beginning of Modern Civilization!

• Food surplus
• People “settle down”
• Populations grow and disease spreads
• Creation of “Jobs” and social inequality
• Long distance trade
• Warfare
• Technology begins
What did Neolithic people farm?

- Sheep
- Lentils
- Goats
- Chickpeas
- Barley
- Wheat
Farming now...

How fertile is the fertile crescent today?

What happened?

What do the colors show you in this satellite image?
Desertification

Soils are vital to agriculture, regulating carbon budgets, and a valuable source of biodiversity.
How does desertification occur?

• Cut down forests to make room for crops
• Exposes soil to erosion from wind, rain and gravity
• Loss of soil = loss of nutrients to grow crops = fewer crops
• Eventually farmer leaves, but there isn’t enough soil to allow plants to grow back fast enough = more soil erodes
• Desertification means people can’t support themselves and have to move. This could threaten 50 million people over the next 10 years.
• Grazing is the major cause.
• Top of the United Nations environmental agenda.
• According to the UN, an area of fertile soil the size of Ukraine erodes every year.

2104849.0.2008_the_year_of_global_food_crisis.php
Is desertification the only problem?

Regional effects:
- Loss of farm land
- Pollution of rivers with silt
- Eutrophication
- Soil carries chemicals and contaminates drinking water

Global effects:
- Agriculture in tropical regions impacts global climate change.
- Air pollution-soils carried from China to Hawaii

China’s Yangtze River 1.6 billion tons of sediment is washed away each year.
Is this a global issue?
Brazil

- Farmers slash-and-burn large parcels of forest for grazing and crop lands.
- Amazon has nutrient-poor soil that is not suited for agriculture, and within a year or two, the farmers move on.
- World demand for biofuels is driving the deforestation for soybean fields.
- Rainforests store carbon helping to reduce global greenhouse gas emissions.
- Brazil now ranks fourth in global greenhouse gas emissions due to clear cutting.

Namibia, South Africa

Desertification caused by drought and exacerbated by the practice of cooking over open fires with brush and trees for fuel. It depletes what few plants there are. That results in less and less water.

Here are a group of kids from a peace corps run environmental group who have built a solar oven helping to educate their families on more sustainable alternatives.

China, Gansu Province

Drought and unsustainable farming practices are turning cropland into desert at an alarming rate. “Yellow dust” is blown hundreds of miles.

Photograph by George Steinmetz
http://ngm.nationalgeographic.com/ngm/data/2002/01/01/html/zm_20020101.4.1.html

People use straw to hold soil down and help plants grow.
Dust Bowl

Drought and poor agricultural practices dried out the soil in Oklahoma, Kansas, Texas, Iowa, and New Mexico. It was carried by wind in large dust storms and settled in the Atlantic Ocean. This ruined millions of acres of farmland and left over 500,000 people homeless.

This led to the Natural Resource Conservation Service, a massive campaign to get farmers to adopt better farming practices, and the planting of 200,000 million trees from Canada to Texas for a wind break and to hold soil and water down.
Will farming continue to feed the world?

Henry Kissinger as Nixon’s Secretary of State in the mid-70’s called a World Food Conference to solve food shortages and world hunger. They resolved to eradicate hunger by the mid-1980s. Kissinger pledged that "within a decade, no child should go hungry to bed".

"Yet, a generation later, more than 800 million people worldwide are still constantly hungry. And the new food crisis threatens to be even worse than the last one."

A 10,000 year case study...

- Archaeologists studying the remains of Neolithic villages in Jordan and Spain saw the “before and after pictures” of farming.

Before:
Description of Jordan: Tall forests, types of plants, near the fertile crescent

After:
Are the effects always the same?

Archaeologists want to understand how our decisions impact the landscape and in turn affect our survival.
The Medland Project

- Interdisciplinary and international team
- Mediterranean Basin
- Neolithic (8,000 B.C.E.-agricultural beginnings) through the Bronze Age (2,000 B.C.E. early cities)
- Studying the effects of farming and animal herding on landscapes and societies
Models

Agent model captures human social structure

Communication

Landscape model captures climate, landforms, surface processes (erosion), and vegetation
What Did They Find?

- Agriculture initially increased biodiversity.
- If resources are difficult to acquire, people will make more sustainable decisions.
- The best farming strategies are dependent on the region and situation.
- Changes in climate during the Neolithic forced people to live differently. They abandoned big cities and moved to small farming villages.

**HUMAN DECISIONS CHANGED THE LANDSCAPE.** **THE CHANGING LANDSCAPE AFFECTS OUR SURVIVAL AND THE DECISIONS WE MAKE.**
