Article: Collaborative Planning and Adaptive Management in Glen Canyon: A Cautionary Tale+

+ The authors thank Joe Dimento, Kirk Emerson, Judy Innes, Judy Layzer, Carrie Menkel-Meadow, Mary Orton, and Connie Ozawa for their helpful comments on earlier drafts, and the editors of the Columbia Journal of Environmental Law for their editorial assistance.

NAME: Lawrence Susskind*, Alejandro E. Camacho** and Todd Schenk***

BIO: * Ford Professor of Urban and Environmental Planning, Massachusetts Institute of Technology; Co-Director, MIT-USGS Science Impact Collaborative.

** Associate Professor of Law, Notre Dame Law School; Visiting Professor, University of California, Irvine School of Law.

*** Ph.D. candidate, Massachusetts Institute of Technology.

SUMMARY:

... Had Congress and the DOI focused on developing a successful dispute resolution process, the AMP would have been better positioned to:) Identify the various interest groups that should be involved and their interests;) Ensure that the relevant federal and state agencies understand and respect the interests of the non-governmental stakeholders involved;) Understand and clarify the priorities that ought to be attached to the competing national interests at stake in the management of the Colorado River, the Dam, and the surrounding area and determine how to reconcile these interests; and) Encourage joint fact finding and, based on the findings of its scientific advisory groups, agree on a set of adaptive management experiments that would help the AMP gain better information, manage uncertainty, and learn over time how to improve at resource management. ... To improve management and storage of water from the river, the Bureau of Reclamation constructed the Glen Canyon Dam above Lee's Ferry, Arizona and created Lake Powell between 1956 and 1963. ... In January 1997, Secretary of the Interior Bruce Babbitt signed a Charter for the AMWG, which prescribes the following duties for the group: establish operating procedures; advise the Secretary of the Interior in meeting the environmental and cultural commitments in the EIS Record of Decision; recommend a framework for AMP policy, goals, and direction; recommend resource management objectives for the long-term monitoring plan and any other research required to assess the impact of the Dam's operations; contribute to and review the mandated yearly report to Congress and relevant state governors; review long-term monitoring data to assess whether or not goals are being met and make operations and resource management recommendations accordingly; and monitor and report on all program activities undertaken to confirm that they are in compliance. ... For example, evidence from three, well-publicized controlled flood experiments indicates that vulnerable species, particularly the humpback chub, greatly benefit from seasonal flow changes, yet no subsequent changes have been made to long-term operations to incorporate such information. ... Members claimed, "stakeholders received no advance notice from Interior/Reclamation on HR 4733"; there was "no AMWG meeting called to discuss and consequently no AMWG consensus or recommendation on

the proposed bill"; "one stakeholder went outside the AMP process"; despite being within the "institutional home" for the GCMRC, AMWG was "entirely omitted" from the Appropriations Bill; and the "Secretary did not respond to stakeholders who wrote letters ... opposing the funding cap." ... Unfortunately, this new release regime seems to signal that the program will not be relying on the short-term releases primarily as iterative experiments for making long-term management decisions about Dam operating criteria but rather as tools for engaging in stop-gap natural resource management. ... Conclusion Despite the best of intentions and the availability of considerable resources, the Glen Canyon Dam AMP has failed to bring stakeholders together to jointly increase their understanding of the Colorado River and make useful, broadly supported resource management recommendations.

TEXT: [*2]

Introduction

Increasingly, governmental bodies ⁿ¹ and scholars ⁿ² - including the authors ⁿ³ - have been promoting the integration of adaptive management and **collaborative planning** into regulatory processes to address deficiencies in conventional regulatory decision making. Adaptive management advocates stress that resource management should be more dynamic, changing over time to adjust to new information and shifting ecological and social conditions. ⁿ⁴ Proponents of **collaborative planning** maintain that the best management processes involve stakeholders working jointly to make decisions, rather than government agencies ordaining [*3] resource management decisions independently. ⁿ⁵ Involving all stakeholders from the beginning is likely to lead to more broadly supported and thus more successful agreements. ⁿ⁶ When combined, these two innovations are sometimes referred to as collaborative adaptive management ("CAM"). ⁿ⁷

One of the most prominent attempts at CAM involves the Department of the Interior's ("DOI") decision to rely on CAM, in principle, to carry out its responsibilities under the Grand Canyon Protection Act of 1992 ⁿ⁸ to monitor the operation of the Glen Canyon Dam, ⁿ⁹ operate the Dam in compliance with a range of laws and regulations, ⁿ¹⁰ and mitigate any significant environmental impacts. ⁿ¹¹ The Act stipulates that a variety of stakeholders - including several federal agencies, states, power generators, recreational users, and environmental organizations - must be consulted regarding dam operations. ⁿ¹² An Environmental Impact Statement ("EIS") released in 1995 recommended "adaptive management" as the best approach to accomplish these tasks. ⁿ¹³ The 1995 EIS recommended using CAM because of the significant uncertainties surrounding the socio-ecological systems involved, as well as the importance of learning from practice and ongoing research to improve operations over time. ⁿ¹⁴

Bruce Babbitt, the Secretary of the Interior at the time, responded to the 1995 EIS by creating the Glen Canyon Dam Adaptive Management Program ("AMP"). ⁿ¹⁵ At the heart of the [*4] AMP is the Adaptive Management Working Group ("AMWG"), which is a formal federal advisory committee whose charter was signed in January 1997. ⁿ¹⁶ In addition to the AMWG, the AMP now includes the Technical Working Group ("TWG"), the Grand Canyon Monitoring and Research Center ("GCMRC"), and Independent Review Panels ("IRP"), and has an annual operating budget of approximately eleven million dollars. ⁿ¹⁷

Many of its public and private participants, as well as observers of the decade-old participatory experiment, have described the AMP in glowing terms. ⁿ¹⁸ Secretary of the Interior Dirk Kempthorne and other key Interior officials identified the AMP as one of the most successful examples of adaptive management in America. ⁿ¹⁹ Dr. Carl Walters of the University of British Columbia's Fisheries Centre went so far as to suggest that Glen Canyon's AMP, while not perfect, is one of the few successful efforts to implement adaptive management. ⁿ²⁰ Dennis Kubly - the Bureau of Reclamation's program manager for the AMP - offers a more tempered analysis, but ultimately points toward the research that has been conducted to date as a sign of success. ⁿ²¹

We disagree, and the proof is in the results. ⁿ²² After thirteen years and millions of dollars, the AMP has failed to stabilize or otherwise improve the quality of the fragile downstream ecosystem. ⁿ²³ [*5] Furthermore, the AMP has been unable to make substantial progress toward resolving the significant resource conflicts at the heart of the Dam's

operations. ⁿ²⁴ Kubly notes that for adaptive management to succeed, "knowledge must make its way into policy decisions that promote a balance between the historical primary purposes of Glen Canyon Dam (i.e., water delivery and hydropower production) and the more recently considered protection of natural resources in the Colorado River ecosystem." ⁿ²⁵ This fundamentally has not happened, and stakeholders have grown restless. ⁿ²⁶

What has gone wrong? The adoption of a collaborative adaptive management approach is not the problem. In fact, CAM is a technique well suited for managing the Glen Canyon Dam, and the AMP incorporates a number of important innovations, including a well-funded research program that has conducted experiments providing valuable scientific information about the downstream ecosystem. ⁿ²⁷ The Glen Canyon Dam offers an ideal opportunity for the systematic application of collaborative adaptive management, especially since scientific uncertainty and disagreements have been central to the ongoing acrimony among stakeholders. If [*6] implemented effectively, CAM can lead to more sustainable management of natural resources and increase public support for whatever tradeoffs have to be made among ecological, economic development, and social welfare objectives. By bringing all parties to the table, more information - including a clearer presentation of the risks associated with managing the area's resources - can be obtained. When trust is fostered, parties are more open to searching for ways of meeting the interests of others rather than simply fighting for their personal interests. CAM can encourage careful review of how previous management efforts have and have not worked. ⁿ²⁸

The problem is that the Glen Canyon Dam AMP has implemented CAM ineffectively, largely due to Congress and the DOI's deficient initial design. Congress abdicated its responsibility to provide clear guidance regarding the relative priority of competing resource goals and the importance of various program components. Equally importantly, the DOI failed to follow commonly identified best practices in collaborative and adaptive resource management in structuring the AMP. Without clear direction or a commitment to resolving the ongoing resource management conflicts, the AMP missed multiple opportunities both to foster agency and stakeholder learning and to cultivate constructive engagement of the stakeholders who care the most about the Colorado River and the socio-ecological system it supports.

Though the Glen Canyon Dam AMP has fallen short of its promise, its experience offers important lessons that can guide future regulatory innovations. When Congress or federal agencies encourage CAM, they can take steps to help harness the full [*7] potential of this approach to collaborative governance. Through its shortcomings, the Glen Canyon AMP demonstrates that successful CAM requires careful institutional design at the outset along with continuing systematic assessment and joint reflection among stakeholders throughout the regulatory process.

In Part I of this article, we introduce the resource conflicts on the Colorado River, outline the Glen Canyon Dam's regulatory setting, and explain how the Glen Canyon Dam AMP functions. In Part II, we present persistent problems at Glen Canyon. In Part III, we identify six best practices in collaborative adaptive management that the AMP has failed to follow: (1) identifying appropriate stakeholder representatives; (2) involving stakeholders in developing a collaborative process; (3) using professional neutrals and encouraging consensus building; (4) incorporating joint fact-finding to deal with scientific uncertainty; (5) producing collectively supported written agreements; and (6) committing to build long-term management capabilities. We explain the benefits of utilizing each best practice and analyze the extent to which, based on available evidence, the Glen Canyon Dam AMP appears to fall short in putting the practice to use. Finally, we conclude by suggesting how legislatures and agencies can avoid the Glen Canyon Dam AMP's shortcomings when implementing future collaborative adaptive management programs.

I. The Colorado River's Enduring Resource Conflict and the Glen Canyon Dam

The Colorado River is the lifeblood of much of the western United States, providing water to seven American states and Mexico. What was once a wild river, flowing from the Rocky Mountains through parched deserts and the Grand Canyon into the Gulf of California, is now heavily utilized and highly regulated. The Law of the River ⁿ²⁹ - a collection of statutes, agreements, [*8] regulations, and numerous court decisions - dictates how the river will be managed, including how water will be allocated among the various users and territories.

To improve management and storage of water from the river, the Bureau of Reclamation constructed the Glen Canyon Dam above Lee's Ferry, Arizona and created Lake Powell between 1956 and 1963. ⁿ³⁰ The total cost of the project was \$ 314 million. ⁿ³¹ This location was chosen because Lee's Ferry marks an important division between the upper and lower basins of the Colorado River - the upper being the States of Colorado, New Mexico, Utah, and Wyoming, and the lower being Arizona, California, and Nevada. Each basin is entitled to 7.5 million acre-feet of water each year under the Colorado River Compact of 1922. ⁿ³² That leaves 1.5 million acre-feet for Mexico, in accordance with the Mexican Water Treaty of 1944. ⁿ³³ The Dam allows the upper basin to meet its treaty obligations by releasing nine million acre-feet while holding back [*9] its share. ⁿ³⁴ The Bureau of Reclamation can store water in Lake Powell - and Lake Mead downstream - and release it when necessary to smooth out the Colorado's significant year-over-year variability in flow and ameliorate the impacts of droughts. ⁿ³⁵ As detailed in this Part, in light of the various stakeholders with diverging interests in the Dam's operation, as well as the wide range of often conflicting laws that influence the management of the Dam and the surrounding natural resources, Congress established the Glen Canyon AMP as an innovative experiment in resource management.

[*10]

A. The Stakeholders

In addition to operating the Dam to ensure that obligations under the Law of the River are met, other competing considerations influence how the Dam is operated. First, while the primary purpose of constructing the Glen Canyon Dam was to regulate the flow of the river, a secondary objective has always been to generate hydroelectric power. ⁿ³⁶ Revenue from power sales is paying off the Dam's construction debt, albeit slowly. ⁿ³⁷ Operating the Dam optimally for hydroelectric power generation requires fluctuating water releases throughout the course of each day, depending on demand. ⁿ³⁸ Second, some advocate for operating the Dam in a manner that alleviates environmental impacts. Over time, concerns arose regarding the Dam's impacts on the environment and endangered species such as the humpback chub. Traditionally, the Colorado swelled in the spring with sediment-laden snowmelt, then receded in the summer, depositing the sediment and replenishing sandbars in the process. ⁿ³⁹ Species indigenous to the area, including the humpback chub, adapted to these conditions over time. ⁿ⁴⁰ The operations regime favored by hydroelectric interests and used in practice disrupts these natural conditions: water is impounded, making it cooler and allowing the sediment to settle, then released through turbines in fluctuations defined by electricity needs. ⁿ⁴¹ Conservationists have, therefore, called for changes in water releases aimed at ameliorating these impacts, including slower ramping rates and high-flow releases in spring. ⁿ⁴² Finally, groups with other interests - such as sport fishing, [*11] whitewater rafting, other recreational interests, and protecting cultural sites - influence how the Dam should be operated.

The Bureau of Reclamation and the states are interested primarily in the water storage services the Dam provides. n43 Their overriding objectives are to meet the demand for water in the arid southwest and fulfill their obligations under the Law of the River. n44 Lake Powell, the reservoir behind Glen Canyon Dam, stores more than 26.2 million acre-feet of water and provides consistent flows to downstream withdrawers even in times of drought. n45 Lowering the reservoir or removing the Dam altogether for environmental reasons could negatively impact storage and usage capabilities, particularly for the upper basin states. n46 The water stored in Lake Powell created by Glen Canyon Dam "serves as a "bank account' that can be drawn on in times of drought." n47 This stored water has made it possible to meet the needs of cities, industries, and agriculture throughout the West during dry periods. n48

[*12] The Bureau of Reclamation, the states, the Western Area Power Administration, and the contractors that

purchase power are also concerned about maximizing power generation. ⁿ⁴⁹ The Dam is an important source of power for the region, producing approximately 4.5 billion kilowatt-hours annually, which offsets about 2.5 million tons of coal or eleven million barrels of oil. ⁿ⁵⁰ The "controlled floods" advocated by some conservation and recreation interests lower the Dam's power generating potential. ⁿ⁵¹ Any changes to the permitted ramping rate (i.e., the speed at which releases change) or seasonal and/or daily restrictions also undercut power generation. ⁿ⁵²

Environmental organizations, including the Sierra Club, opposed the initial plan for what was to become the Colorado River Storage Project Act of 1956, which called for a series of dams along the Colorado River, including two in Dinosaur National Monument. ⁿ⁵³ [*13] The Sierra Club's primary concern at the time was that "no major scenic resource should be sacrificed for a power project." ⁿ⁵⁴ The Sierra Club eventually dropped its opposition to the Colorado River Storage Project Act, including the Glen Canyon Dam, in exchange for project modifications that canceled the two upstream dams at Echo Park and Split Mountain in Dinosaur National Monument. ⁿ⁵⁵ Many environmentalists came to regret this acquiescence. ⁿ⁵⁶ Indeed, in light of concerns about the impact of the Dam on the environment and endangered species, environmental groups have challenged the Dam's existence and management ever since. ⁿ⁵⁷

There are eight endangered and three threatened species in the area: four of the endangered species - the southwestern willow flycatcher, humpback chub, razorback sucker, and Kanab ambersnail - have been adversely affected by dam operations. ⁿ⁵⁸ The humpback chub and razorback sucker are of particular interest because they are found only in the Colorado River Basin. ⁿ⁵⁹ [*14] Despite a recent stabilization in the estimated chub population, ⁿ⁶⁰ their current numbers are much lower than they were before the river was heavily modified. ⁿ⁶¹ According to conservationists, a number of changes caused by building the Dam present challenges to these endangered species, including decreased sediment load, cooler and more constant temperatures, more constant flows rather than natural seasonal variation, beach and bar erosion, and the arrival of invasive species. ⁿ⁶²

Environmentalists also argue that the water storage services the dam provides are not particularly valuable, given that sufficient storage capacity exists elsewhere in the system and that a staggering volume is lost to evaporation from Lake Powell annually. ⁿ⁶³ Recognizing that outright removal of the Dam is unlikely, environmental organizations and other conservation interests, including the U.S. Fish and Wildlife Service, advocate flow modifications, like controlled flood releases and restricted ramping rates. ⁿ⁶⁴ Such modified flow regimes would be designed to restore and maintain the habitat and other conditions essential for species like the humpback chub. ⁿ⁶⁵ Modified flow regimes, however, often conflict with water supply and power interests. ⁿ⁶⁶

The area around Glen Canyon remains only sparsely populated; with no roads and a harsh landscape, the area contained even fewer residents when the Dam was proposed. ⁿ⁶⁷ It is the traditional [*15] territory of the Havasupi, Hopi, Hualapi, Navajo, Pueblo, and Southern Paiute tribes, who attach great religious and cultural significance to sites within the canyons and along the river. ⁿ⁶⁸ It appears, however, that there was little opposition from the tribes at the time of construction, perhaps because the Dam brought tangible economic benefits in the form of employment opportunities, and the Navajo Nation was compensated for the land it lost. ⁿ⁶⁹

Overall, the impacts of the Dam on tribes have been mixed. The Dam and associated tourism are a major source of income for the Navajo Nation and other tribes; ⁿ⁷⁰ however, the flooding of the canyon, ⁿ⁷¹ the erosion resulting from the modified downstream flow, ⁿ⁷² and tourism ⁿ⁷³ have harmed important sacred and historical sites. ⁿ⁷⁴ Beyond specific places of historical and cultural significance that have been impacted, various zones, vistas, and the general attributes of the region are considered culturally important, and even sacred, by both Native American groups and non-native groups in the area, and these vistas and attributes have been altered as a result of the Dam's construction. ⁿ⁷⁵

[*16] Over the years, other groups, such as anglers and rafters, have taken interest in the River, the Dam, and water resource management. A vibrant sport fishery has grown out of the trout that thrive in the cool, clear waters released from the Dam. ⁿ⁷⁶ Anglers from around the world come to the Lee's Ferry area to fish for rainbow trout in the fast-flowing river. ⁿ⁷⁷ While initially stocked, this fishery is now self-sustaining. ⁿ⁷⁸ It is, however, managed as a "blue

ribbon" fishing experience. ⁿ⁷⁹ Anglers benefit from the Dam's operations because the conditions are conducive to the trout fishery. ⁿ⁸⁰ Rafting brings an estimated \$83 million into the local economy annually, generating approximately 600 jobs. ⁿ⁸¹ While rafters generally benefit from the constant flow the Dam releases year-round, this flow and the Dam's trapping of sediment are eroding the beaches that serve as important launch and rest points for the rafting industry. ⁿ⁸² Boating and recreation in and around Lake Powell are also important tourism draws; the Glen Canyon National Recreation Area receives approximately two million visitors annually. ⁿ⁸³

The animosity among these stakeholders has increased over time, as their positions regarding releases have hardened and each has felt increasingly threatened by the demands of others. Though perhaps popular when approved, large dams like the Glen Canyon Dam have become controversial and politically unattractive. Senator Barry Goldwater of Arizona, once a strong supporter of the Glen Canyon Dam, later reflected: "I have to be honest with you. I'd be happier if we didn't have the lake. I'd vote against it. I've become convinced that, while water is important, particularly for those of us who live in the desert, it's not that important." ⁿ⁸⁴ [*17] Additionally, serious conflicts have arisen regarding management of the Colorado River more generally as population growth, economic development, and climate change have exacerbated water scarcity, increased electricity demand, and compounded environmental impacts. ⁿ⁸⁵ Climate change threatens to magnify the problem in the longer term if it reduces stream flow as predicted. ⁿ⁸⁶

The following table summarizes the primary interests of the stakeholder groups involved in the AMP as reflected in their legal mandates and stated interests. ⁿ⁸⁷ Each stakeholder group or agency gets one vote unless otherwise noted (i.e., each of the seven states gets a vote, as do each of the environmental groups). These general views may vary from issue to issue, and certain stakeholder groups may split internally on a specific issue (e.g., though the states often agree, their interests on a particular matter may conflict in important respects).

B. The Regulatory Setting

The Bureau of Reclamation operates the Glen Canyon Dam in accordance with the Colorado River Storage Project Act of 1956. This law authorized construction of the Glen Canyon Dam - along with other dams, reservoirs, power plants, and transmission infrastructure in the upper Colorado basin - and enumerates the Dam's water management and power generation goals. ⁿ⁸⁸ The Bureau of Reclamation, a division of the DOI, was created in 1902 to promote settlement and economic development in the West by facilitating the capture and delivery of water to meet the needs of farmers and communities. ⁿ⁸⁹ Today, it is the largest water [*19] wholesaler in the country, and the second largest producer of hydroelectric power in the Western states. ⁿ⁹⁰ The Bureau's mission has evolved to recognize the various benefits and costs associated with its work of regulating rivers. Today, its declared goal is "to manage, develop, and protect water and related resources in an environmentally and economically sound manner in the interest of the American public." ⁿ⁹¹ Fulfilling this mission involves making difficult choices regarding how dams like Glen Canyon Dam should be operated to balance a variety of interests and comply with numerous regulations.

The regulations governing the Dam's management have changed over time, reflecting both shifting interests among stakeholders and increased scientific understanding. Perhaps as a result, the multiple, and often conflicting, laws and directives governing the operation of the Dam establish no clear prioritization among the various competing usage demands. ⁿ⁹² The only cultural or environmental stipulation in the Colorado River Storage Project Act of 1956 is that the Secretary of the Interior must "take adequate protective measures to preclude impairment of the Rainbow Bridge National Monument." ⁿ⁹³ Various environmental and cultural preservation acts passed in subsequent years - particularly the National Historic Preservation Act (1966), the National Environmental Policy Act (1969), and the Endangered Species Act (1973) - have had major implications for the Dam's operation. For example, the Endangered Species Act explicitly protects the humpback chub, which the Dam has impacted adversely. ⁿ⁹⁴ This statutory protection has been the foundation of numerous lawsuits [*20] and biological opinions filed over the past few decades. ⁿ⁹⁵

In 1992, Congress enacted the Grand Canyon Protection Act ("GCPA") in an effort to consolidate the body of regulations governing the Dam's operations. ⁿ⁹⁶ Rather than clarifying priorities and sorting out conflicting regulations, the GCPA confused matters. While allowing for a decrease in power generation, the GCPA reinforced the water management and hydroelectric priorities the Dam was initially meant to serve. ⁿ⁹⁷ At the same time, it stated that the dam and water resources should be managed in "such a manner as to protect, mitigate adverse impacts to, and improve the values for which Grand Canyon National Park and Glen Canyon National Recreation Area were established, including natural and cultural resources and visitor use." ⁿ⁹⁸ Thus, the GCPA does not set priorities among cultural, environmental, and recreational interests; nor does it mandate how they should be reconciled with water management objectives when the interests conflict. In fact, the GCPA seems to suggest that all demands can be met, and that the GCPA should in no way affect water allocations or conflict with any federal environmental laws.

The GCPA did call upon the Secretary of the Interior to prepare an EIS evaluating the Dam's operations; given the uncertainties, the GCPA asked the Secretary to take responsibility for long-term monitoring of the Dam's impact so that operations could be adjusted over time to account for new information or changed circumstances. ⁿ⁹⁹ Presumably, long-term monitoring would determine the impacts that management has on "the natural, recreational, and cultural resources of Grand Canyon National Park and Glen Canyon National Recreation Area." ⁿ¹⁰⁰ Furthermore, the GCPA requires that such monitoring be conducted in consultation with various stakeholders, ranging from the governors [*21] of the affected states to the recreation industry.

In 1996, Interior Secretary Bruce Babbitt signed the Record of Decision ("ROD") for the EIS. ⁿ¹⁰¹ More than forty

assessments, undertaken by fifteen different agencies, were incorporated into it. ⁿ¹⁰² Among other things, the ROD mandated the creation of an Adaptive Management Working Group ("AMWG"), with various stakeholder representatives empowered to make recommendations regarding the Dam's management to the Secretary of the Interior in light of changing data and within the boundaries set by the relevant rules, regulations, and decisions. ⁿ¹⁰³

C. The Adaptive Management Program

The 1996 Record of Decision mandated the creation of the AMWG, but did not specify requirements beyond stating that it should be chartered in accordance with the Federal Advisory Committee Act ("FACA") to conduct experiments and undertake monitoring that might lead to operational changes, provided they comply with the National Environmental Policy Act ("NEPA"). ⁿ¹⁰⁴

In January 1997, Secretary of the Interior Bruce Babbitt signed a Charter for the AMWG, which prescribes the following duties for the group: establish operating procedures; advise the Secretary of the Interior in meeting the environmental and cultural commitments in the EIS Record of Decision; recommend a framework for AMP policy, goals, and direction; recommend resource management objectives for the long-term monitoring plan and any other research required to assess the impact of the Dam's operations; contribute to and review the mandated yearly report to Congress and relevant state governors; review long-term monitoring data to assess whether or not goals are being met and make operations and resource management recommendations accordingly; and monitor and report on all program activities undertaken to confirm that they are in compliance. ⁿ¹⁰⁵

[*22] The Charter also stipulates that the AMWG will report to the Secretary of the Interior via his or her designee, who will act as the chairperson; that the group is expected to meet biannually; and that membership, which is appointed by the Secretary, should include, but not be limited to: n106

- . The Secretary's Designee;
- . A representative from each of the twelve government authorities associated with the EIS:
- . U.S. Bureau of Reclamation,
- . U.S. Bureau of Indian Affairs,
- . U.S. Fish and Wildlife Service,
- . U.S. National Park Service,
- . Western Area Power Administration,
- . Arizona Game and Fish Department,
- . Hopi Tribe,
- . Hualapai Tribe,
- . Navajo Nation,
- . San Juan Southern Paiute Tribe,
- . Southern Paiute Consortium, and
- . Pueblo of Zuni;

- . A representative from each of the seven Colorado River Basin States; and
- . Two representatives each from environmental groups, recreation groups, and contractors that purchase power generated by the Dam.

The AMWG first met in September of 1997, and spent the next few months establishing itself and proposing operating procedures that outline how the group functions. ⁿ¹⁰⁷ Most significantly, these procedures mandate: Robert's Rules of Order as the default operating manual; the approval of motions through consensus, with recourse to passing motions by a two-thirds majority when the chair deems consensus impossible; and the confirmation of the [*23] standing Technical Work Group ("TWG") as a sub-committee. ⁿ¹⁰⁸

The TWG, which is comprised of technical representatives from each of the groups on the AMWG, is to perform tasks assigned to it by the main group. Tasks include developing "criteria and standards for monitoring and research programs," providing "periodic reviews and updates," "developing resource management questions for the design of monitoring and research" by the GCMRC, and providing information for "preparing annual resource reports and other reports" for the AMWG. ⁿ¹⁰⁹

The GCMRC was created "to provide credible, objective scientific information to the Glen Canyon Dam AMP on the effects of operating Glen Canyon Dam under the Record of Decision and other management actions on the downstream resources of the Colorado River ecosystem, utilizing an ecosystem science approach." ⁿ¹¹⁰ The GCMRC is part of the U.S. Geological Survey, but responds to research questions posed by the AMWG, typically through the TWG. ⁿ¹¹¹ Independent Review Panels, including the Science Advisory Board, independently assess program proposals and outcomes to ensure scientific objectivity and credibility. ⁿ¹¹²

II. The Persistence of Problems at Glen Canyon

Since its creation a decade ago, the AMP has received praise from various agency officials and scholars who maintain that the Glen Canyon Dam AMP is a successful model of collaborative, adaptive regulation and management. ⁿ¹¹³ Despite these accolades and considerable funding, a growing number of observers have concluded that the Glen Canyon Dam AMP has been far from successful. ⁿ¹¹⁴

The Glen Canyon Dam AMP should not be considered a success because it has failed to address effectively the concerns that led to its creation in the first place, including: (1) developing a stakeholder-supported operating plan responsive to increased [*25] understanding; (2) averting litigation and other attempts to resolve conflict outside of the AMP context; and (3) protecting the downstream ecology, including endangered species. ⁿ¹¹⁵ This Part of the article outlines the AMP's failure to achieve these objectives and explains how these failures translate into the persistent problems at the Dam.

A. There Has Been Little Progress on Formulating a Long-term Plan to Operate the Dam

Despite more than fifteen years of research and negotiations, the Dam operates under the same "modified low fluctuating flows" regime as it did in 1996. ⁿ¹¹⁶ This lack of progress is discouraging given the commitment of the AMP and its stakeholders to ongoing adaptive management. Neither Congress nor the AMWG has identified

measurable goals for the AMP; nor has the AMWG made the hard choices needed to prioritize competing uses of the Colorado River. In particular, the Glen Canyon Dam AMP has yet to resolve how power generation should be reconciled with ecological and other uses that compete for the Dam's resources. For example, evidence from three, well-publicized controlled flood experiments indicates that vulnerable species, particularly the humpback chub, greatly benefit from seasonal flow changes, yet no subsequent changes have been made to long-term operations to incorporate such information. ⁿ¹¹⁷

The strongest opposition to flow regime change has come from power generation interests. The Colorado River Storage Project Act of 1956 mandates the maximization of power generation revenues, provided that operations do not impinge on the Colorado River Compact or other relevant compacts. ⁿ¹¹⁸ This mandate gives power interests authorization to operate the Dam in a manner most beneficial to them, subject to other laws. ⁿ¹¹⁹ Controlled floods represent lost revenues to the power industry - an estimated four million dollars in the case of the 2008 [*26] experiment. ⁿ¹²⁰ It is still not clear whether power interests will be compensated for this loss. It is unsurprising, given these losses, that power interests are opposed to changes in the Dam's operation.

The group seems incapable of fashioning creative solutions that meet multiple interests. ⁿ¹²¹ By this time, relatively stable voting blocks have formed. Our review of motions voted on since the AMWG was created confirms that factions are entrenched: environmental organizations, paddlers, the Fish and Wildlife Service, and the National Park Service regularly find themselves on one side, while the states and power generators are often on the other. ⁿ¹²²

B. The AMP Has Been Unable to Avert Unproductive Extra-Programmatic Conflict

Lawsuits filed as early as 1973, only ten years after the Dam was completed, challenged various resource management decisions. ⁿ¹²³ Indeed, it was a legal victory won by environmental groups - National Wildlife Federation v. Western Area Power Administration ⁿ¹²⁴ - that led to the creation of the AMP in the first place. The AMP was created to facilitate conflict resolution without resorting to litigation. Under an effective collaborative adaptive management program, stakeholders would reflect jointly on what they had [*27] learned and engage in collaborative problem solving to improve the Dam's operations. Unfortunately, under the Glen Canyon AMP, stakeholders hold fast to their positions and continue to spend time and resources challenging each other. As a result of the lack of progress, AMWG members have turned to litigation rather than reliance on the AMWG to resolve disputes over dam operations.

In 2006, five environmental organizations sued the Bureau of Reclamation over the impacts the Dam continues to have on endangered species like the humpback chub. This suit was settled when the Bureau of Reclamation agreed to conduct a new study of native fish and habitats in concert with the Fish and Wildlife Service. ⁿ¹²⁵ The Grand Canyon Trust, an environmental group and member of the AMWG, filed a lawsuit against the Bureau of Reclamation in December 2007 accusing the agency of managing water releases to benefit power generators at the expense of the downstream fish habitat. ⁿ¹²⁶ In March 2008, the Grand Canyon Trust and Earthjustice filed a complaint against the Bureau of Reclamation and the Fish and Wildlife Service, alleging Endangered Species Act violations. ⁿ¹²⁷ United States District Judge David Campbell ruled against the Fish and Wildlife Service in May 2009, requiring the agency to reconsider its approach to evaluating the Dam's impacts on humpback chub. ⁿ¹²⁸

C. The Downriver Ecology is Still in Jeopardy

In 2008, the Fish and Wildlife Service reiterated that the ecosystem below the Dam has been heavily modified from its pre- [*28] dam state. ⁿ¹²⁹ Federal agencies are attempting to ameliorate the situation by making further flow modifications and removing nonnative species, but the changing stream flow (particularly coldwater releases and unnatural flow regimes caused by the Dam) and land use changes have greatly diminished the species' habitat. ⁿ¹³⁰ The humpback chub thrive in warm, sediment-rich flows that create fast moving currents, eddies, and associated beach formations. ⁿ¹³¹ The Fish and Wildlife Service postulates that, historically, humpback chub were found throughout the Grand Canyon, while today they are largely confined to a few sections and tributaries that remain largely undisturbed by human intervention. According to the Fish and Wildlife Service, "many of the physical changes in the post-dam

Colorado River are believed to have contributed to eliminating spawning and recruitment of humpback chub in the mainstem river." n132

The precarious state of the downriver ecology is particularly disconcerting because anticipated stressors, such as climate change, are likely to strain the ecosystem even further. Fish and Wildlife acknowledges that the effects of climate change should factor into how the Dam is operated, as the low reservoir levels associated with droughts from 2004 to 2006 demonstrate the potential for climate change to impact humpback chub. ⁿ¹³³ Perhaps more disturbingly, recent findings by University of Colorado researchers suggest that climate change and population growth could dry up the Colorado River's reservoir by 2057. ⁿ¹³⁴ This would profoundly impact human settlements, agriculture, and the riverine environment.

Recent evidence suggests that the humpback chub may have temporarily benefitted from recent temporary high-flow releases. These releases are byproducts of AMP experiments with various flow regimes used to assess the impacts on species populations and ecosystem health starting in 1996. ⁿ¹³⁵ The U.S. Geological Survey [*29] ("USGS") reported in April 2009 that humpback chub populations increased by fifty percent between 2001 and 2008, a significant recovery after steady declines in the 1990s. ⁿ¹³⁶ The USGS acknowledges the difficulty of determining why the population rebounded, but argues that the experimental water releases are probably one factor. ⁿ¹³⁷

One might consider the humpback chub's recovery to be evidence that the AMP is doing its job. After years of research, however, debates continue regarding whether or not flow regimes should be permanently modified to protect the health of the chub population. ⁿ¹³⁸ Furthermore, the AMP's reluctance to adopt a modified flow regime or even to continue with high flow tests ⁿ¹³⁹ suggests that any successes attributable to the experimental water releases are only temporary and could be erased by the cessation of controlled flooding. Though the DOI recently directed the development of a protocol for conducting even more high-flow experiments, ⁿ¹⁴⁰ the fact that ongoing dam operations have never been formally changed to incorporate the apparent benefits of the experimental releases on downriver ecosystems indicates the AMP's limited commitment to adaptive management and jeopardizes the ancillary ecological benefits obtained through experimentation.

III. The Shortcomings of the AMP as a Collaborative Adaptive Management Program

The AMP has failed to achieve its potential because it has not addressed significant process management questions. Evidence from a diverse range of complex, multi-party regulatory conflicts has led scholars and dispute resolution professionals to recommend a set of "best practices" for managing environmental and land use disputes. ⁿ¹⁴¹ The Consensus Building Handbook, the [*30] product of a five-year effort by four dozen of America's leading dispute resolution professionals, reviews these best practices in great detail, indicating how properly managed and structured group decision-making and joint fact-finding efforts can lead to workable agreements. ⁿ¹⁴² Although incorporating the Handbook's practices into a regulatory program does not guarantee full resolution of very contentious resource disputes, there is considerable evidence that doing so helps foster scientifically credible agreements and creative long-term solutions to complex resource problems. ⁿ¹⁴³ Moreover, mounting evidence suggests that both participants and outside observers are more satisfied when these practices are followed, even if no final agreement is reached. ⁿ¹⁴⁴

In The Consensus Building Handbook, Susskind and Thomas-Larmer outline how conflict assessment procedures should be used to identify both the relevant stakeholders in a resource management dispute and what issues ought to be addressed in order to maximize the chance of reaching an informed agreement. ⁿ¹⁴⁵ Straus enumerates how to facilitate collaborative efforts in order to ensure that all participants feel like they have [*31] had a say in the design of the decision-making process. ⁿ¹⁴⁶ Poirier Elliott explains why professional neutrals regularly improve the effective management of collaborative decision-making bodies. ⁿ¹⁴⁷ Potapchuk and Crocker stress the importance of formulating agreements that have a clear and accountable pathway to implementation. ⁿ¹⁴⁸ Ehrmann and Stinson describe how stakeholders ought to engage with technical experts in joint fact-finding. ⁿ¹⁴⁹

Prescribing many of the same practices as The Consensus Building Handbook, the DOI's Adaptive Management

Technical Guide emphasizes the need for group learning and ongoing improvement in how to manage collaborative decision-making. ⁿ¹⁵⁰ Unfortunately, as detailed below, the DOI has failed to incorporate at least six vital practices for achieving truly collaborative and adaptive management into the AMP's design and operation. As a result, the AMP has failed to cultivate meaningful relationships among the stakeholders and has failed to develop the multilateral AMWG into an effective, deliberative decision-making body.

The remainder of this article focuses on six best practices that, according to our research, the AMP does not utilize: (1) identifying appropriate stakeholder representatives; (2) setting clear goals and involving stakeholders in developing a collaborative process; (3) using professional neutrals when appropriate and committing to building common ground; (4) incorporating joint fact-finding to deal with scientific uncertainty; (5) producing collectively supported written agreements; and (6) building long-term adaptive management capabilities. For each best practice, we explain why it is central to collaborative adaptive management and how, in our view, the AMP has failed to implement it successfully.

[*32]

A. Identifying Appropriate Stakeholder Representatives

Ensuring that all influential and substantially affected parties are at the table is critical to the success of any collaborative process. ⁿ¹⁵¹ If such a party is not included, the party will likely feel unrepresented and might resort to other means to undermine what the collaborative process has achieved. ⁿ¹⁵² Furthermore, if such a party is not included, the collaborative body might miss out on important input that could have contributed to reaching an even better agreement. ⁿ¹⁵³

The literature suggests that the best way to identify appropriate stakeholder representatives is by commissioning a "conflict assessment" in which a professional "neutral" conducts informal, not-for-attribution interviews with a first group of stakeholders recommended by the convener of the collaborative process. ⁿ¹⁵⁴ As part of these interviews, the professional neutral asks the stakeholders with whom else he should speak. The process is repeated until all relevant players have been included. Based on these interviews, the neutral then suggests to the convener the categories of relevant stakeholder groups and suggests who might represent each stakeholder category in a collaborative process. ⁿ¹⁵⁵ Often, a draft of the neutral's proposal is circulated to everyone who was interviewed before it is submitted to the convener. ⁿ¹⁵⁶

In the case of the Glen Canyon Dam AMWG, the charter dictates certain stakeholder groups who must be at the table and allows the Secretary of the Interior to add parties at his or her discretion. ⁿ¹⁵⁷ Where the charter does not stipulate specific representatives or representative organizations for a given stakeholder group, the Secretary of the Interior chooses the representative. ⁿ¹⁵⁸ This allows the Secretary to choose parties with whom it might be easiest to work and exclude significant critics who might later challenge the [*33] group's decisions.

Ultimately, the AMP's process for determining representation was neither complete nor transparent, and likely the unfortunate result of lobbying behind closed doors. ⁿ¹⁵⁹ Meeting minutes from the initial "Transition Work Group," which was formed to operate until the formal AMWG was constituted, provide surprisingly little documentation of discussions about membership. ⁿ¹⁶⁰ Transition Work Group members expressed the need for diverse membership and for an information-and-training session on membership requirements. ⁿ¹⁶¹ There appears to be no indication in the record, however, of how the Secretary of the Interior chose stakeholder representatives. ⁿ¹⁶² This lack of transparency raises substantial questions regarding the adequacy of AMWG representation and ultimately the legitimacy of subsequent AMWG decisions.

The number or fraction of representatives from various categories of stakeholder groups has also been criticized. n163 While not of critical importance when a group operates by consensus, group composition is very important when decisions are made by majority or super-majority voting, because such dynamics may lead to formation of coalitions that force issues through while ignoring minority objections, as has happened with the AMP. Almost half of the motions

put forward at AMWG meetings between March 2004 [*34] and May 2008 went to a vote. ⁿ¹⁶⁴ Power generation interests have been able to garner a majority, and often a two-thirds majority, frequently by obtaining the support of the states and sometimes the tribes. For example, a motion to conduct no "Beach/Habitat-Building Flows" in fiscal year 2005 was narrowly approved by a margin of thirteen "yes" votes to six "no" votes and one abstention; the meeting minutes suggest that the states teamed up with power interests because of their desire to maximize power production. ⁿ¹⁶⁵ Frustrated with this perceived imbalance against them, environmental groups have turned to litigation, which clearly undermines the consensus-oriented intention of the AMP process. ⁿ¹⁶⁶ In part because the Secretary never invited open discussion of which stakeholders should participate and how many votes each interest group has, ⁿ¹⁶⁷ the AMWG has fallen short of functioning as a collaborative decision-making body for addressing the resource conflicts surrounding the Glen Canyon Dam. ⁿ¹⁶⁸ Instead, as evidenced by a majority of motions bypassing consensus in favor of a vote, unbalanced representation has seemingly led some parties to conclude that they are better off forcing a vote that they can consistently win. ⁿ¹⁶⁹

B. Providing Clear Goals and Involving Stakeholders in Developing Operating Procedures that Guide the Collaborative Process

Best practices suggest that all stakeholders ought to have a chance, before they come to the table, to participate in the design [*35] of a collaborative process, including setting an agenda, drawing up a timetable, deciding how data gathering or fact finding should proceed, choosing technical advisors, setting a budget, and, most importantly, selecting a neutral facilitator to manage meetings and decision-making. ⁿ¹⁷⁰ Existing evidence suggests that active stakeholder involvement at an early stage is crucial to fostering a workable and productive collaborative process; active stakeholders typically take greater ownership of decision making and are more likely to craft a process that pleases all affected parties. ⁿ¹⁷¹ Accordingly, to establish effective collaborative management, Congress must provide clear guidance as to the program's purposes and make stakeholders responsible for effectuating these objectives.

Unfortunately, Congress neither mandated meaningful opportunities for stakeholder involvement nor provided clear direction as to the goals and structure of the AMP. Even though Congress retains the ultimate authority (and thus responsibility) for specifying the AMP's goals and design, Congress delegated the responsibility to the Secretary of the Interior. ⁿ¹⁷² In doing so, Congress failed both to set forth clear objectives for the new program and to require ample opportunities for active stakeholder involvement in refining the goals and crafting the decision-making ground rules. Neither Congress nor the DOI provided participants a significant role in establishing the AMP's mandate or specifying its operating procedures. For example, while members of the Transition Work Group were given an opportunity to comment on the draft charter introduced by a Bureau of Reclamation representative, the draft was submitted to the Secretary of the [*36] Interior in short order with few changes. ⁿ¹⁷³ Had Congress and DOI followed best practices, stakeholders would have been intimately involved in defining operating procedures from the beginning rather than simply having the perfunctory opportunity to comment. After the AMWG's formation, the staff of the Secretary's Designee drafted the AMWG's operating procedures at the group's behest. ⁿ¹⁷⁴

The poor manner in which the AMP was designed was partly the product of DOI officials' interpretation of the FACA of 1972. Congress passed FACA to enhance the accountability and credibility of the various advisory committees created by federal agencies. ⁿ¹⁷⁵ While its intentions are laudable and the mechanisms it mandates to guide the creation and operation of advisory committees foster transparency, its requirements can be restrictive, limiting opportunities for committees to craft the most contextually appropriate solutions. Nonetheless, some collaborative processes in America governed by FACA have incorporated the aforementioned best practices. ⁿ¹⁷⁶

The design of the AMP further failed to utilize best practices because of stipulations that the Secretary of the Interior imposed on its design. Under these stipulations, the Secretary's designee serves as AMP chair and is responsible for establishing agendas, finalizing meeting minutes, and defining the outcomes the group will seek. ⁿ¹⁷⁷ Extant procedures allow stakeholders to add items to the agenda and to speak on them at meetings; permit members of the general public to speak; assure that dissenting opinions are conveyed to the Secretary in the minutes; and mandate a response from the Secretary regarding how recommendations are being [*37] used. ⁿ¹⁷⁸ Even though these procedures

provide stakeholders some opportunity to participate, they ultimately confine stakeholders to the conventional lobbying role and do not constitute a real system of power-sharing.

Consequently, the DOI gives little consideration to the views of AMWG members when making important management decisions regarding the Glen Canyon Dam. For example, in January 2008 the Secretary's Designee moved forward with a proposed experimental test at the Dam without soliciting the AMWG's recommendations. ⁿ¹⁷⁹ Similarly, AMWG members complained there was little discussion of the AMP's fiscal year 2001 budgetary allocation (H.R. 4733 of the Energy and Water Development Appropriations Bill). Members claimed, "stakeholders received no advance notice from Interior/Reclamation on HR 4733"; there was "no AMWG meeting called to discuss and consequently no AMWG consensus or recommendation on the proposed bill"; "one stakeholder [went] outside the AMP process"; despite being within the "institutional home" for the GCMRC, AMWG was "entirely omitted" from the Appropriations Bill; and the "Secretary did not respond to stakeholders who wrote letters ... opposing the funding cap." ⁿ¹⁸⁰

The absence of a clear regulatory mandate and stakeholder responsibility for implementing this charge has led to further problems. Beyond stakeholders having little say in how the AMP is structured, uncertainty persists around how the AMWG, TWG, GCMRC, and the IRP interact as well as what roles and responsibilities these AMP components have. ⁿ¹⁸¹ For example, AMWG members have asserted that they should have greater influence over the technical work of the GCMRC, while the GCMRC counters that it is not accountable to the AMWG. ⁿ¹⁸² [*38] Procedural confusion has sometimes been accompanied by substantive disagreement. The AMP has failed, for example, to agree on targets and priorities. ⁿ¹⁸³ By failing to delineate clearly the functions and duties of different program components, Congress and the Secretary of the Interior have not only detached stakeholders from management, but have also unwittingly created a muddled regulatory structure.

C. Committing to Identifying Common Ground and Cultivating Consensus

Collaborative adaptive management is premised on a commitment to promoting better understanding among stakeholders and seeking to develop shared decision making. To help accomplish this goal, best practices suggest that professional neutrals (or neutral teams) often provide value by facilitating or mediating the work of multiparty, ad hoc advisory, or collaborative planning groups and by identifying and fostering common ground. n184 Effective facilitation or mediation extends beyond the management of face-to-face meetings. Professional neutrals know how to work with parties "away from the table" to help them prepare for meetings and to present and defend their views effectively. n185 Aside from the skill professional neutrals bring to the management of group decision-making, evidence suggests that their involvement increases the chances that the process will be fair. n186 Ideally, professional neutrals also have relevant expertise [*39] that enables them to identify creative options that might meet each party's interests. Though an outside professional neutral is not always needed for a group to work collaboratively, n187 in many situations outside mediators are more effective, as they are likely to be more objective, have the greatest degree of impartiality, and the greatest motivation to maintain confidentiality. n188

In its April 2007 "Report and Recommendations to the Secretary's Designee," the Roles Ad Hoc Group - an AMWG committee formed to review the AMWG's progress - suggested that the level of collaboration between Glen Canyon Dam stakeholders had actually fallen since the inception of the AMP process. ⁿ¹⁸⁹ This represents a significant failure to bring parties together to develop outcomes that are viewed as mutually beneficial, and raises a question about how and whether the AMP leadership expected consensus to emerge on key questions facing the group.

As mentioned previously, the Secretary's designee chairs the AMWG. As a government employee and the Secretary's representative, the designee is not a "neutral." Furthermore, no designees thus far have been professional mediators, so they might lack the skills needed to facilitate the work of a complex and politically charged group like the Glen Canyon Dam AMP. The designees, and their positions, have been:

. Stephen Magnussen, Director, Operations for Reclamation (July 1997-February 2002);

- . Michael Gabaldon, Director, Policy, Management, and Technical Services (February 2002-March 2006);
- [*40] . Mark Limbaugh, Assistant Secretary, Water and Science (March 2006-July 2007);
- . Brenda Burman, Deputy Assistant Secretary, Water and Science (July 2007-July 2008);
- . Kameran Onley, Assistant Secretary, Water and Science (July 2008-August 2009); and
- . Anne Castle, Assistant Secretary, Water and Science (August 2009-present).

A review of the designees' biographies confirms that all were either career civil servants with technical backgrounds and managerial experience or political appointees. ⁿ¹⁹⁰ There is no indication that any designee received significant training in dispute resolution. Unsurprisingly, the Roles Ad Hoc Group reported that AMWG members perceive a lack of clear communication between the designees and the rest of the AMWG. ⁿ¹⁹¹ The AMP lacked facilitation aimed at generating informed consensus.

Starting in 1999, the AMP used a trained dispute resolution professional to help facilitate some of its meetings and to assist the AMWG and TWG with strategic planning; however, because the individual was a former stakeholder group member, it leaves the AMWG vulnerable to claims that the individual was not sufficiently neutral. ⁿ¹⁹² While she helped the Secretary's designee organize, [*41] plan, and run AMWG meetings, the dispute resolution professional's role in building consensus has also been somewhat limited. ⁿ¹⁹³ Rather than empowering a professional neutral to devise a consensus-based approach to move the stakeholders towards outcomes based on "joint gains," the AMP lodges decision-making authority with the Secretary's designee and grants this individual the authority to move a motion to a vote at his or her discretion. ⁿ¹⁹⁴ Furthermore, the dispute resolution specialist has had almost no engagement with stakeholders outside of formal meetings, nor has she dealt with other actors as an AMP representative, despite the Role Ad Hoc Group's recognition that such help is needed. ⁿ¹⁹⁵ No record in the AMWG minutes suggests that stakeholders played a role in reviewing candidates for the facilitator's job, or in preparing the contract that spelled out the terms and conditions of her hiring. ⁿ¹⁹⁶ All of these deficiencies suggest that little or no attention was given to involving professional neutrals in group decision-making or more generally to promoting collaborative decision-making.

In fact, as structured, the AMWG provides little opportunity for, or encouragement of, consensus building. ⁿ¹⁹⁷ For example, [*42] participants reached consensus on only half of the motions put before the AMWG between March 2004 and May 2008. ⁿ¹⁹⁸ Even though consensus is a stated goal of AMWG meetings, the Secretary's designee can simply choose to take a vote at any time, meaning that one side can force the motion to a vote when it senses it can prevail. ⁿ¹⁹⁹ Since building consensus requires significant time and resources, ⁿ²⁰⁰ quick voting undercuts the commitment to consensus and encourages each party to focus on building a "winning coalition" rather than searching for a creative solution that meets everyone's interests. ⁿ²⁰¹ As the Roles Ad Hoc Group recommends, parties need to "establish and agree to a common mission/goal for the AMP"; ⁿ²⁰² the AMP should "create incentives for participants to work collaboratively to achieve common goals and desired future resources conditions"; ⁿ²⁰³ the AMP should "create incentives for participants to work collaboratively to achieve common goals and desired future resources conditions"; ⁿ²⁰⁴ and the group should "update or develop a charter and operating procedures for all the elements of the AMP (AMWG, TWG, GCMRC, and Secretary's Designee) to reflect a more collaborative approach." ⁿ²⁰⁵

The rigidity of the AMWG's procedure for developing agendas and structuring meetings - some of which FACA mandates - inhibits the creativity and flexibility consensus building requires. ⁿ²⁰⁶ [*43] The AMWG's procedures more closely resemble those of a formal body following Robert's Rules of Order than those of a more informal, problem-solving group following a consensus-based approach. ⁿ²⁰⁷ In fact, the group explicitly agreed early on to follow Robert's Rules, while allowing for some flexibility. ⁿ²⁰⁸

Frustration caused by some groups' ability to get their way without having to seek broad consensus has inevitably led to a loss of faith in the process among those who regularly find themselves on the losing side. ⁿ²⁰⁹ We attribute this in part to a failure to commit to the best practices associated with consensus building, particularly the appointment of a

professional neutral selected by the full group. As noted previously, in the absence of a commitment to consensus building, the parties have turned to other tactics, primarily litigation.

D. Establishing and Following Clear Joint Fact-Finding Procedures

Disagreements about "the facts" are critical to many disputes. Each party has its own understanding of what is happening on the ground and typically amasses evidence to substantiate and reinforce its own perceptions. In many situations, one side hires technical experts to prove they are right. Of course, other parties view such findings with skepticism, and, when they can afford to, hire their own technical experts to contradict the other side's experts.

Joint fact-finding ("JFF") - a best practice that suggests data ought to be gathered jointly - provides a way to move beyond such [*44] stalemates. ⁿ²¹⁰ When engaged in JFF, parties work together to identify what they need to know and to select independent experts that they all agree are credible. ⁿ²¹¹ After working together with the experts to design the relevant research and reviewing the preliminary findings together, the parties might interpret the expert's findings differently, but they will have little reason to reject the legitimacy of the data that has been collected. ⁿ²¹² By moving beyond disagreements about data, the parties can address more substantive issues, like the significance of the data and the appropriate responses to it. ⁿ²¹³

Of course, uncertainty may persist under JFF, and new data will affect the parties' understandings of the issue; however, the aim of JFF is not to develop an absolutely conclusive set of facts, but rather to reach tentative agreement on the facts at a given time in the process and to allow for collaborative research and subsequent evolution in management as more is learned. ⁿ²¹⁴ Indeed, adaptive management is premised on the notion of recurring monitoring and research, and adaptation to new information. ⁿ²¹⁵ Effective adaptive management programs do not pretend to have all of the answers, nor do they allow uncertainty to cripple decision-making; rather, they facilitate agreement on what is known and unknown at a given point, what decisions should be made in light of this information, and what information should be collected moving forward. ⁿ²¹⁶

To the AMP's credit, the parties do have the ability to craft research questions through the TWG, and unlike other experimental initiatives like the U.S. Fish and Wildlife Service's Habitat Conservation Plan program, ⁿ²¹⁷ the AMP includes a well-funded scientific monitoring and research apparatus - the [*45] GCMRC. The GCMRC is responsible for most of the research used by the AMWG, either directly or indirectly. Its mission is "to provide credible, objective scientific information to the Glen Canyon Dam Adaptive Management Program on the effects of operating Glen Canyon Dam on the downstream resources of the Colorado River ecosystem, utilizing an ecosystem science approach." ⁿ²¹⁸

If the AMP were to provide clear guidance establishing the GCMRC's scientific neutrality while giving the AMWG the authority and responsibility to identify research priorities, this would enable the GCMRC to have the rare capacity to assist the AMWG in making long-term resource management decisions; however, such guidance has not been forthcoming. Neither Congress nor the DOI has provided clear direction regarding the goals of the AMP or the "chain of command" between the AMWG and the GCMRC. n219 As a result, GCMRC officials claim that the AMWG has failed to provide clear guidance to the GCMRC on the scientific questions that the GCMRC should investigate. n220 On the other hand, some AMWG members have claimed that the GCMRC remains purposefully ignorant of their needs. n221 As an arms-length government body, the GCMRC is responsible for providing data to the AMWG and TWG, but is not under the AMWG and TWG's direction. n222 Since all GCMRC staff are government employees or contractors, AMWG and TWG members have little or no say about whom the GCMRC hires on contract or what their work shall entail. n223

The AMP has used Independent Review Panels to make fact-finding efforts more objective and credible, but like the GCMRC, these panels are not directly associated with the AMWG. The panels, which include a Science Advisory Board comprised of respected academic experts, assess and monitor the credibility of [*46] GCMRC program proposals and outputs. ⁿ²²⁴ Yet, because the panels are set up by and report to the GCMRC, their reviews are not responsive to the interests and concerns of the AMP's stakeholders. Furthermore, some AMWG members argue that

advisory board members are not forthright in their criticism out of fear of offending the research center and their contract staff, thereby putting them at risk of losing future work. n225

The panels and the GCMRC are convened on the premise that distinguished experts can add legitimacy to the regulatory process at Glen Canyon Dam because these experts stand above the political fray. Even so, though scientists regularly provide crucial information that can help resolve natural resource disputes - including assessments of the potential tradeoffs of alternative strategies - technical analysis should only inform, and not dictate, political decision-making. ⁿ²²⁶ By allowing the GCMRC and independent review panels to operate without being responsive or accountable to the AMWG, Congress and the Department of the Interior severely crippled the AMWG's ability to manage uncertainty regarding the questions central to the Dam's management. Because scientists alone cannot provide definitive and objective answers on the priorities for management or an optimal resolution of policy tradeoffs, stakeholders must be engaged in defining researchable questions and analyzing the results of any technical studies undertaken.

The dispute surrounding the AMP's much-publicized experimental flood releases exemplifies the prolonged and unproductive conflicts that result from the AMP's inadequate fact-finding procedures. The GCMRC has conducted a variety of experiments to understand the Dam's impacts on the downstream ecosystem as well as to test out various flow regimes. ⁿ²²⁷ Many of these experiments have involved releasing different volumes of [*47] water over different time periods and evaluating the results. ⁿ²²⁸

Because AMWG members have had less input in crafting the research program than they would in a true joint fact-finding process, stakeholder criticism of how research has been conducted is inevitable. The most controversial issues during these tests have included: interpreting the impacts of high-flow releases on the river, beach development, and conditions for indigenous species and the trout fishery; deciding what experiments should be conducted and when; deciding how such impacts should be measured; and agreeing on what the ideal outcome should be. ⁿ²²⁹ For example, at the August 2007 AMWG meeting, an environmental representative voiced concern that the monitoring and research plan did not represent a true ecosystem approach. ⁿ²³⁰ At the April 29-30, 2009 meeting, the states and power interests voted against a motion to conduct high flow experiments in fiscal year 2010-11, ostensibly because they felt that the results of the 2008 high flow experiment should be interpreted first. ⁿ²³¹ Though stakeholders might criticize research even under a joint fact-finding process, the failure to include stakeholders in shaping the research agenda unnecessarily increased the potential for conflict and delegitimized the data-gathering process.

Because they were peripheral to the research program's design, stakeholders also have not treated the research findings as tools for facilitating joint problem solving, but rather used them as ammunition to advance their own positions. For example, at the April 2009 meeting, rafting and endangered species advocates cited the success that modified flow regimes had in restoring sandbars as [*48] reason to lobby for their long-term use. ⁿ²³² Since high-flow releases appear to provide habitats for endangered species, the AMP may continue to use such releases to comply with the Endangered Species Act. ⁿ²³³ Hydropower interests, on the other hand, cite significant revenue losses and problems with meeting electricity demand when flows are not regulated based on power needs. ⁿ²³⁴ Thus, they advocate maintaining the status quo of traditional release patterns, which maximize power generation revenues. ⁿ²³⁵

A well-designed JFF process would not eliminate such arguments. It would, however, require each stakeholder to acknowledge those aspects of their policy advice that are based on fact and those that reflect subjective judgments or wishful thinking. As each group advocates a particular policy choice, the factual bases for their prescriptions would be clear to all sides.

AMP stakeholders have also used the absence of a clearly delineated fact-finding process as a delay tactic. ⁿ²³⁶ Uncertainty can never be fully eliminated, but parties who benefit from the status quo demand that changes be made based only on selective information and perpetuate claims of uncertainty by challenging the results of experiments. ⁿ²³⁷ A clear joint fact-finding process could help limit opportunities for delay and other adversarial, self-seeking behavior on the part of stakeholders by managing uncertainty, moving the process toward agreement on the legitimacy of the

underlying data, and providing a framework for constantly improving that data. n238

[*49] In short, the AMP can and should implement a joint fact-finding process. The stakeholder-comprised TWG has the capacity to formulate researchable questions, and the GCMRC has the resources and objectivity to play a major role in conducting and managing the research process. Effective joint fact-finding remains elusive, however, due to the lack of stakeholder support and the absence of a clear relationship between the AMWG and the GCMRC. As a result, factual conflict is often the main issue between stakeholders, preventing the AMP from focusing its energy on collaborative decision making.

E. Producing Collectively Supported and Functional Written Agreements

Best practices suggest that a collaborative process, especially one that is explicitly designed to generate decisions, should produce a text used for negotiation that all parties can ultimately sign and that spells out agreements that have been reached along with commitments the parties have made. ⁿ²³⁹ Preparing minutes or summaries of meetings does not suffice. Rather, drafting possible terms of a written agreement in the process of negotiating "provides a record of discussions" and "reduces the chance of later misunderstanding." ⁿ²⁴⁰ A written record of discussions should also include places for the parties to indicate their personal commitments to help implement what has been worked out, regardless of whether they have the legal authority to enter into enforceable contracts. ⁿ²⁴¹

In the case of Glen Canyon Dam, the stakeholders have not developed written agreements that address the core issues before the AMP. The AMP has adopted a strategic plan that includes a mission statement and lists a range of goals for the Colorado River [*50] ecosystem. ⁿ²⁴² Despite this, many of the "desired resource conditions" stated in the strategic plan are not necessarily compatible. For example, it is far from clear that the goals (1) "[to] maintain or attain viable populations of existing native fish, remove jeopardy from humpback chub and razorback sucker, and prevent adverse modification to their critical habitat" and (2) "[to] maintain power production capacity and energy generation, and increase where feasible and advisable, within the framework of the Adaptive Management ecosystem goals" can be achieved simultaneously. ⁿ²⁴³ The strategic plan outlines the positions and roles of the various stakeholders and program components, introduces the boundaries set by relevant legislation, and notes that conflicts may emerge between efforts to meet the various goals. ⁿ²⁴⁴ However, the strategic plan offers no guidance as to how to reconcile these conflicts. Because of its focus on integrating research findings into management decisions, the strategic plan seems to expect that conflicts can be overcome with more and better information. ⁿ²⁴⁵

While accurate and generally-accepted facts are needed, even the best joint fact-finding cannot overcome inherently conflicting uses of the same limited resource. As a result of these limitations, the Roles Ad Hoc Group found that the underlying conflicts among the listed goals have not been resolved, that no quantifiable targets had been established for any of the AMP's goals, and that many stakeholders had "never committed to defining or achieving specific resources objectives or desired future resource conditions." ⁿ²⁴⁶ Rather than spending time on these fundamental issues, the AMWG has focused instead on "the details of the AMP, sometimes duplicating TWG efforts." ⁿ²⁴⁷ Again, this failure can at least in part be attributed to Congress's failure to clarify program goals and the relative status of resource uses under the GCPA. ⁿ²⁴⁸

The AMWG has also been ineffective because the parties have never agreed on how AMWG recommendations will be factored into decision-making by the Secretary of the Interior. After each [*51] AMWG meeting, the Secretary's designee unilaterally prepares a "formal summary report" for the Secretary and sends copies to participants without providing any opportunity for participants to comment. ⁿ²⁴⁹ Although the designee must represent dissenting opinions to the Secretary when consensus is not reached, the designee remains free to interpret the outcomes and report in the manner he or she wishes. The Secretary, in consultation with agency management, is the sole decision maker on how AMWG recommendations are incorporated into formal actions; ⁿ²⁵⁰ the only stipulation is that the Secretary's decisions be reported back to AMWG members. ⁿ²⁵¹ Members have expressed concern regarding the lack of communication and the opaque manner in which decisions are made. ⁿ²⁵² Responses from the Secretary are rare and vary widely in their substantive detail. ⁿ²⁵³ Because AMWG members have no ownership of and make no commitment to the agreements

reached, and the Secretary is completely free to make decisions with no accountability to the group, stakeholders have incentives to circumvent the collaborative process and lobby the Secretary or others directly. ⁿ²⁵⁴

F. Managing the AMP Adaptively and Cultivating Long-Term Capacity Building

Best practice suggests that adaptive resource management is a long-term task that requires the building of ongoing institutional and organizational capacity. ⁿ²⁵⁵ Adaptive management should include not only systematic monitoring, assessment, and adaptation [*52] in response to individual regulatory decisions made by the stakeholder group, but also reconsideration of the regulatory program itself. ⁿ²⁵⁶ This approach allows the convener, the stakeholders, and the broader public to evaluate a program's progress toward meeting public goals, and enhances the institutional capacity to follow through on commitments that have been made. Further, a long-term oriented approach helps ensure that the group learns from mistakes and gets better at dealing with each successive round of adjustments required in an on-going adaptive management process.

Despite the AMP's asserted emphasis on adaptation, the program has failed to engage in genuine adaptive natural resource management - both in its concrete decisions concerning resource allocation and in how it manages the AMP itself. For example, though the AMP's highly publicized experimental flood releases from the Glen Canyon Dam have been much celebrated, they are, in fact, examples of missed opportunities to engage in adaptive natural resource management. The floods certainly provided the AMP with important scientific data about the Colorado River's downstream hydrology and ecosystems, but the information gained did not modify operations at Glen Canyon Dam. In other words, there was no adaptive management. To date, a decade after the establishment of the AMP, no adjustments to long-term management operations of the Dam have been made. ⁿ²⁵⁷

The Secretary of the Interior recently directed the development of a protocol for conducting additional experimental high flows. ⁿ²⁵⁸ Unfortunately, this new release regime seems to signal that the program will not be relying on the short-term releases primarily as iterative experiments for making long-term management decisions about Dam operating criteria but rather as tools for engaging in stop-gap natural resource management. While perhaps more favorable for the downriver ecosystem than the current low flow regime, such an approach does not demonstrate a rigorous commitment to adaptive management.

In addition to failing to commit to using the information gleaned from regulatory experiments to adjust long-term management protocols at Glen Canyon Dam, little or no attention is being paid [*53] to building the AMWG's and AMP's long-term capacity. The only attempt to assess the AMP's progress was to form the Roles Ad Hoc Group. However, the Roles Ad Hoc Group's recommendations for improving the AMP have been neither adopted nor formally rejected by either the AMWG or the DOI. ⁿ²⁵⁹ Furthermore, stakeholder representatives have identified technical weaknesses and difficulties in meeting the AMP's participatory requirements, but the DOI has provided no training or organizational development investments in response. ⁿ²⁶⁰

Programmatic evaluations are necessary to foster ongoing improvements, but the AMP has failed to commit the resources needed. While some efforts have been made to enhance meeting management, there has been no effort to systematically evaluate the process or to even monitor it on a regular basis. ⁿ²⁶¹ The National Research Council has suggested that an adaptive management specialist - someone who can help parties deal with the tension between research and policy decisions - is sorely lacking and would be invaluable. ⁿ²⁶² Without incorporating a systematic approach to monitoring and adapting the program, the agency, stakeholders, Congress, and the public are crippled in their ability to assess and improve the AMP as the program matures.

[*54]

Conclusion

Despite the best of intentions and the availability of considerable resources, the Glen Canyon Dam AMP has failed to

bring stakeholders together to jointly increase their understanding of the Colorado River and make useful, broadly supported resource management recommendations. The management of the Dam has not reflected an informed consensus on either scientific or non-technical questions, and has left the humpback chub and other species and habitats at risk. The AMP has not evolved into an increasingly competent joint management body; rather, it still plays an uncertain advisory role to the Secretary of the Interior. Fundamentally, the failure of the AMP stems from questionable decisions by Congress and the Secretary of Interior regarding the AMP's design and operation.

A better CAM process requires government authorities to adopt clear enabling authority that establishes the goals of the program and makes stakeholders responsible for progressing toward these objectives. Had Congress and the DOI focused on developing a successful dispute resolution process, the AMP would have been better positioned to:

- 1) Identify the various interest groups that should be involved and their interests; n263
- 2) Ensure that the relevant federal and state agencies understand and respect the interests of the non-governmental stakeholders involved;
- 3) Understand and clarify the priorities that ought to be attached to the competing national interests at stake in the management of the Colorado River, the Dam, and the surrounding area and determine how to reconcile these interests; and
- 4) Encourage joint fact finding and, based on the findings of its scientific advisory groups, agree on a set of adaptive management experiments that would help the AMP gain better information, manage uncertainty, and learn over time how to improve at resource management.

The Glen Canyon Dam AMP shows that a stated commitment to collaboration and adaptive management is insufficient. Effective joint management of natural resources can only be realized through careful attention to the design and implementation of appropriate problem-solving and adaptive-management [*55] procedures. It also requires the development of an appropriate organizational infrastructure that promotes stakeholder dialogue and agency learning. Though the experimental Glen Canyon Dam AMP is far from a success of collaborative adaptive management, the lessons from its shortcomings can foster more effective CAM in the future by Congress, federal agencies, and local and state authorities. Should legislators and regulators learn to build more robust collaborative and adaptive institutions from the Glen Canyon Dam experience, the legacy of the Glen Canyon Dam AMP, which has been underwhelming thus far, might be well worth the wait.

n51. Controlled flows undercut power generation. Flows can be managed to maximize profit by responding to shifting changes in electricity prices, but the flows required to achieve these goals are not necessarily the flows that ensure maximum environmental protection. Furthermore, during controlled high flows, water is released via bypass tubes, representing lost generation capacity. Hydropower, supra note 38. According to Western Area Power Administration projections, the total cost of purchasing power elsewhere to compensate for reduced generation during the 2008 high flow test year was estimated to be \$ 4.1 million. Bureau of Reclamation, U.S. Dep't of the Interior, Final Environmental Assessment for Experimental Releases from Glen Canyon Dam, Ariz., 2008 through 2012 6 (2008) [hereinafter Final Environmental Assessment], available at http://www.usbr.gov/uc/envdocs/ea/gc/2008hfe/GCD-finalEA2-29-08.pdf. This represented a 9.4% increase in the amount required to purchase power. Id. at 37.
n52. Hydropower supra note 38; Glen Canyon Dam Adaptive Mgmt. Work Group, Dep't of the Interior, Final Minutes of April 29-30, 2009 Meeting 14 (2009) [hereinafter Final Meeting Minutes April 2009], available at http://www.usbr.gov/uc/rm/amp/amwg/mtgs/09apr29/Final_Mi nutes.pdf ("If you equalize the months, it causes us to be short of power to meet our contracts during those peak months and it will cause us to be long on power in the off-peak months. [We] would have to buy from the market in order to meet the contracts and peak months our prices tend to be higher and in the off-peak months we will be long on power. We will be selling the excess off in times when prices are down because they are off-peak months. So this would have a definite financial impact to power.").

Work Group, Dep't of the Interior, Minutes of July 21-22, 1999 Meeting (1999), available at http://www.usbr.gov/uc/rm/amp/amwg/mtgs/99jul21/Final_Mi nutes.pdf; American Rivers, About Us, http://www.americanrivers.org/about-us/ (last visited Jan. 22, 2010) (stating American Rivers, which the facilitator represented at the July 1999 meeting, is "the leading conservation organization standing up for healthy rivers so communities can thrive. American Rivers protects and restores America's rivers for the benefit of people, wildlife, and nature."); see also Glen Canyon Dam Adaptive Mgmt. Work Group, Dep't of the Interior, Final Minutes of January 11-12, 2001 Meeting 9 (2001), available at http://www.usbr.gov/uc/rm/amp/amwg/mtgs/01jan11/Final_Mins.pdf (detailing perceived concerns of bias raised in a performance evaluation survey the facilitator conducted in 2000).

n193. Report and Recommendations, supra note 168, at 6 (stating that "facilitation and mediation expertise [should be used] more broadly throughout the AMP," including within the TWG and outside of the formal process via trips and exercises to build trust and foster collaboration).

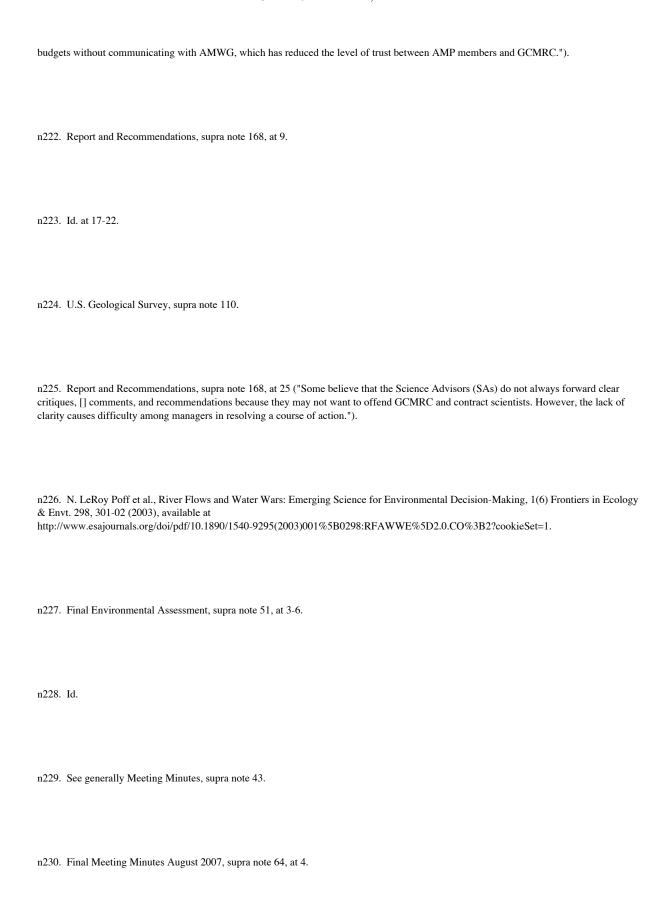

n194. Camacho, Beyond Conjecture, supra note 92, at 958-59 ("The exact point in time when consensus may be established to be impossible - thus paving the way for a super-majority vote - is never delineated in the AMWG's operating procedures. The Secretary's Designee, not the mediator-facilitator, decides on his or her own option when to switch to a two-thirds vote As there are no time constraints or other detailed protocols governing when to seek consensus and when to follow a two-thirds decision rule, the convenor's discretion becomes of critical importance in determining how the AMWG actually functions.").

n204. Id.
n205. Id. at 6.
n206. See Final Operating Procedures, supra note 108, at 2-3 ("The maker of a motion must clearly and concisely state and explain his or her motion. Motions may be made verbally or submitted in writing in advance of the meeting After a motion there should be presentations by staff followed by a discussion and a call for questions. The public will be given opportunity to comment during the question period as allowed by the Chairperson The group should attempt to seek consensus but, in the event that consensus is not possible, a vote should be taken. Voting shall be by verbal indication or by raised hand. Approval of a motion requires a two-thirds majority of members present and voting.").
n207. The AMWG generally adheres to Robert's Rules of Order. See Final Operating Procedures, supra note 108, at 1. For a contrast between Robert's Rules and a consensus-based approach, see Susskind & Cruikshank, supra note 108.
n208. Meeting Minutes September 1997, supra note 107, at 4-5.
n209. Camacho, Beyond Conjecture, supra note 92, at 959-60 ("An AMWG's ad hoc committee concluded that "some stakeholders feel disenfranchised because some interests have more representation on the group; this is especially significant when consensus is not achieved and issues get resolved by a vote.' Stakeholders consistently in the minority are increasingly seeing little incentive to expend their limited resources in a process that consistently ignores them, turning instead to costly litigation to address issues the AMWG has not confronted.").

n231. Final Meeting Minutes April 2009, supra note 52, at 12-13. "The [Environmental Assessment] and the [Biological Assessment] both are pretty specific about what additional work needs to be done before more High Flow Experiments or Beach/Habitat-Building Flows, are to be conducted and there is a requirement in the EA that full scientific and public analysis of the 2008 experiment be completed. There is language to that effect in the BA that says there will be the development of predictive and other analytic tools to inform future tests before they're done and that there will not be a proposal to do additional high flow tests until the information from the 2008 HFE is fully analyzed And as we know from the presentations yesterday some of that won't be completed until the end of fiscal year 2010." Id. at 12. Despite this opposition, the Secretary of the Interior recently directed the development of a protocol for conducting further experimental high flows. See December 2009 News Release, supra note 140.
n232. Final Meeting Minutes April 2009, supra note 52, at 12-13.
n233. Final Biological Opinion, supra note 23, at 23.
n234. Final Meeting Minutes April 2009, supra note 52, at 14.
n235. See generally Meeting Minutes, supra note 43. For example, during the August 2004 meeting, the following was raised: "Anything that can be done to lessen the impact to the basin fund would be good. Given the drought conditions, it may be better to go to existing powerplant conditions and provide a bridge so as to not impact the basin fund. He added that they may be putting the AMP in jeopardy if they ask for money from Congress and then let money out of the fund when money could be generated by the power revenues." Final Meeting Minutes August 2004, supra note 43, at 17. Similarly, challenges from stakeholders who claim the tests are not worth their environmental impacts and that the tests may contravene the Law of the River undermine the usefulness of these experiments. For example, a motion to implement seasonally-adjusted steady flows in 2008 was opposed by an AMWG member on the grounds that reduced power generation might lead to more greenhouse gas emitting coal-fired power generation. Final Meeting Minutes August 2007, supra note 64.
