

THE UNIVERSITY OF MARYLAND

BALTIMORE COUNTY CAMPUS  
Department of Psychology

24 May 1989

Dear Viktor,

I have enclosed a recent chapter. As always, I invite your comments. I would especially like to hear your opinion of the section concerning "Spontaneous movement and its neural correlates" (p 36-39). How did I handle the matter of relating the cord bursts to the EMG activity?

As usual, Anne, Landmesser, and O'Donovan ignore the cord work except for a rare "straw man" treatment. The work that I published during my St. Louis days still stands up and nicely complements the EMG work. I never viewed the people mentioned above as competitors but they apparently are. Their scholarship seems to be a tool that is used only when expedient. I hope that my own writing is more balanced and fair. What do you think? Do you have any reservation about my earlier cord work? Do others? It is always easier to respond to and learn from criticism than neglect.

Sincerely,

Bob

P.S. Your thoughts on the yawn work would also be appreciated!
